

Base360.ai — AI Conversations, Reimagined

AI SaaS Landing Page UX/UI Case Study

Designer: Jananie Logendra

1. Project Overview

Base360 is an AI-powered communication platform that helps B2C businesses manage customer conversations across multiple channels through one unified system.

This case study explores the end-to-end UX/UI design process of creating a modern SaaS landing page that communicates the product's value, builds user trust, and encourages conversions. The project focuses on transforming a feature-rich AI platform into a simple, engaging, and conversion-oriented user experience.

2. Product Understanding

Base360 is designed to simplify customer communication by bringing multiple channels including social media comments, direct messages, WhatsApp, SMS, phone calls, and email into one intelligent platform.

The platform enables businesses to:

- Manage customer conversations from a unified inbox
- Automate repetitive tasks using AI agents
- Capture and qualify leads automatically
- Build customer relationships through an integrated CRM
- Convert conversations into measurable business opportunities

Understanding these core capabilities formed the foundation for every design decision throughout the project.

3. Design Process

To create a structured and user-centered solution, I followed a complete UX design process before moving into the final interface.

The design process included:

- Project Overview
- Product Understanding
- Problem Statement
- Business Goals
- Target Audience
- Competitor Research
- User Journey
- Information Architecture
- Wireframes
- Visual Direction
- Design System
- High-Fidelity Interface Design
- Responsive Design
- Final Reflection

This approach ensured that every design decision aligned with both user needs and business objectives.

4. Design Goal

The primary challenge was presenting a technically complex AI platform in a way that feels approachable, understandable, and valuable to potential customers.

The experience was designed around a simple storytelling framework:

Problem → Solution → Product Value → Trust → Conversion

This structure guides users naturally from recognizing their communication challenges to understanding how Base360 solves them and finally encourages them to take action.

5. Visual Direction

The visual language was designed to reflect a modern, premium AI SaaS product.

Key design decisions include:

- Deep navy backgrounds to establish trust and professionalism
- Teal and green gradients representing intelligence, automation, and growth
- Rounded cards and subtle glass-inspired surfaces to create depth
- Strong typography hierarchy for improved readability
- Product-focused visuals that reinforce credibility

Together, these elements create a clean and contemporary interface that reflects the innovation behind the product.

6. Design System

A scalable design system was developed to maintain consistency across the entire experience.

The system includes:

- Color Palette
- Typography
- Spacing Scale
- Grid System
- Buttons
- Cards
- UI Components
- Interaction States

Building reusable components improves consistency, simplifies future updates, and supports long-term scalability.

7. Interaction Design

Interaction design was used to make the interface feel intuitive and responsive.

Reusable components were created with hover states for:

- Navigation links
- Call-to-action buttons
- Dashboard cards
- Data containers
- Interactive content blocks

These micro-interactions provide immediate visual feedback, improve discoverability, and create a more polished user experience.

8. Final Landing Page

The landing page follows a conversion-focused structure designed to educate users while gradually increasing confidence in the product.

Hero Section

The hero immediately communicates the platform's core value through a clear headline and supporting product preview.

Dashboard Preview

A realistic dashboard showcases business metrics, AI performance, and operational insights to demonstrate the platform's capabilities.

Social Proof

Brand references and performance metrics establish credibility early in the user journey.

Problem Section

The "Chaos" section illustrates the challenges of fragmented communication and missed customer opportunities.

Solution Section

The "Transformation" section introduces a simple three-step workflow:

- Ingest
- Analyze
- Convert

This simplifies the AI workflow into an easy-to-understand narrative.

Core Engine

A bento-style layout highlights the platform's major capabilities, including:

- Unified AI Inbox
- AI Agents
- Adaptive CRM
- Deep Analytics

Visual hierarchy emphasizes the platform's primary features while supporting exploration.

Customer Journey

A step-by-step scenario demonstrates how a customer interaction progresses through AI automation into a successful conversion, helping users visualize real business value.

Final Call-to-Action

The experience concludes with a conversion-focused CTA supported by trust indicators such as GDPR compliance, SOC2 Type II, and a no-credit-card-required free trial.

9. Responsive Design

The desktop experience was carefully adapted for mobile devices while preserving the overall storytelling flow and visual hierarchy.

Layouts were simplified, navigation was optimized for touch interactions, and calls-to-action remained easily accessible across different screen sizes.

The objective was to provide a seamless experience regardless of device.

10. Deliverables

11. Key Takeaways

This project demonstrates my approach to designing user-centered digital experiences by combining product understanding, UX strategy, interaction design, and visual communication.

Throughout the process, every design decision was guided by five key principles:

- Simplicity
- Clarity
- Consistency
- Trust
- Conversion

The final outcome is a scalable, modern SaaS landing page that communicates Base360's value through thoughtful storytelling, structured information architecture, and a polished user interface.
