PROJECT OVERVIEW

Figure 1 Mr. Barber admin dashboard page

- Project Name: Mr. Barber
- Project Type: Mobile Barber Service Booking Application
- Role: UI/UX Designer
- Platform: Mobile Application
- Duration: Academic Project
- Tools Used:
 - Figma
 - Canva
- Project Description:

Mr. Barber is a mobile-first barber service booking application designed to simplify the appointment scheduling process between customers and barbers. The application enables users to browse services, select preferred barbers, choose available time slots, and book appointments through a streamlined and user-friendly interface.

The project focused on creating an intuitive user experience, reducing booking friction, improving appointment visibility, and delivering a modern mobile interface tailored to both customers and barber shop operations.

PROBLEM STATEMENT

Traditional barber shops often rely on walk-in appointments and manual scheduling methods, which can lead to long waiting times, overcrowding during peak hours, and uncertainty regarding barber availability.

Customers frequently experience difficulties when trying to book appointments in advance, while barbers struggle to manage schedules efficiently and maintain a smooth customer flow.

The lack of a centralized digital booking system creates inconvenience for both customers and service providers, ultimately affecting the overall customer experience.

Therefore, a mobile-based booking solution was needed to simplify appointment scheduling, improve service accessibility, reduce waiting times, and provide a more convenient experience for users.

PROJECT GOALS

The primary goal of the Mr. Barber application was to create a seamless and user-friendly mobile booking experience for barber shop customers.

The project aimed to:

- Reduce customer waiting times through advance appointment scheduling.
- Allow users to easily browse available services and select their preferred barber.
- Improve appointment management and schedule visibility.
- Create a simple and intuitive booking process that can be completed within a few steps.
- Deliver a modern, mobile-first user experience with a clear visual hierarchy and easy navigation.
- Enhance customer satisfaction by providing a convenient and efficient booking solution.

TARGET USERS

The Mr. Barber application was designed for individuals who value convenience, time efficiency, and a seamless appointment booking experience. The platform serves both customers seeking grooming services and barber shop staff responsible for managing appointments and schedules.

Primary Users

➤ Working Professionals

Busy individuals who prefer scheduling appointments in advance to avoid long waiting times and better manage their daily routines.

➤ University Students

Students looking for quick and affordable barber services that can be booked easily through a mobile application.

➤ Regular Barber Shop Customers

Frequent customers who want a faster and more convenient alternative to traditional walk-in appointments.

Secondary Users

➤ Barbers

Professionals who need a clear view of upcoming appointments, customer bookings, and daily schedules.

➤ Barber Shop Administrators

Staff members responsible for managing appointment availability, customer flow, and overall shop operations.

USER PAIN POINTS

Through user analysis and observation of traditional barber shop booking processes, several common pain points were identified.

➤ Long Waiting Times

Customers often spend significant time waiting for their turn due to walk-in based operations.

➤ Lack of Appointment Visibility

Users are unable to view barber availability and appointment schedules in advance.

➤ Manual Booking Process

Traditional appointment scheduling methods are often inefficient and time-consuming.

➤ Uncertainty in Service Planning

Customers may arrive at a barber shop without knowing whether their preferred barber is available.

➤ Limited Convenience

Users must physically visit or call the barber shop to make appointments, creating unnecessary effort.

These challenges highlighted the need for a digital booking platform that improves accessibility, convenience, and appointment management.

Pain Point	Impact
Long Waiting Time	Poor customer experience
Manual Scheduling	Time consuming
No Availability Information	Appointment uncertainty
Walk-in Dependency	Inefficient service planning
Limited Convenience	Reduced accessibility

Table 1 - Pain points and impact summary table

RESEARCH SUMMARY

The research phase focused on understanding how users interact with traditional barber shop booking systems and identifying key gaps in the experience.

Primary research insights were gathered through observation of customer behavior, informal feedback, and analysis of common salon/barber shop workflows.

Key Findings:

- Most users prefer quick and hassle-free appointment booking methods.
- Customers value time efficiency and want to avoid long waiting periods.
- Many barber shops still rely on manual or phone-based scheduling systems.
- Users prefer knowing barber availability before visiting the shop.
- Mobile-first solutions significantly improve convenience and accessibility.

Conclusion:

The research confirmed a clear need for a digital solution that simplifies appointment booking, reduces waiting time, and improves communication between customers and barbers. These insights directly influenced the design decisions made in the wireframes and final UI.

USER PERSONAS

To better understand the needs, behaviors, goals, and frustrations of different users, multiple user personas were created during the design process.

These personas represent the primary user groups identified during research and helped guide design decisions throughout the project.

By understanding user expectations and pain points, the application was designed to provide a more intuitive, efficient, and user-centered booking experience.

Purpose of Personas

- Understand different user needs and behaviors
- Identify common pain points
- Support user-centered design decisions
- Improve usability and accessibility
- Validate design solutions against real user scenarios

Five user personas were created to represent different customer types and booking preferences within the Mr. Barber ecosystem.

Persona 1 – Owner*Figure 2 Persona 1 – Owner*

This persona represents the barbershop owner who is responsible for overall business operations and decision-making. He is focused on reducing customer waiting time, improving staff efficiency, and increasing customer satisfaction and revenue. He regularly checks appointment schedules, queue status, and performance reports to understand peak hours and service demand. His main challenges are handling high customer demand and managing staff workload during busy periods. Therefore, the system is designed to provide him with a real-time admin dashboard, analytics, and easy management tools so he can make quick, data-driven decisions to improve business performance.

Persona 2 – Operational Admin

Figure 3 Persona 2 – Operational Admin

This persona represents the Branch Manager who is responsible for overseeing the daily operational activities of the barbershop. She focuses on efficiently managing appointments and walk-in queues, allocating barbers according to availability and workload, and ensuring smooth customer flow, especially during peak hours. She continuously monitors service status updates, handles last-minute cancellations, and responds to customer concerns to maintain service quality. Her main challenges include balancing barber workload, managing sudden walk-in rushes, and updating service progress accurately in real time. Therefore, the system is designed to provide her with a live operational dashboard, clear status indicators, quick dropdown controls for updating service stages, and easy navigation between queue and appointment sections, enabling her to make fast decisions and ensure efficient day-to-day workflow management.

Persona 3 – Customer Persona (Busy Professional)

Figure 4 Persona 3 – Customer Persona

This persona represents a working professional who has very limited time and values speed and convenience. He prefers to book appointments quickly, avoid long queues, and choose his preferred barber and time slot without going through many steps. He usually uses the app during short breaks and expects instant confirmation and reminders. His main pain point is wasting time due to unexpected waiting or complex booking flows. Therefore, the UI is designed with a fast booking process, saved preferences, and real-time queue notifications to support his busy lifestyle and provide a smooth, time-saving experience.

Persona 4 – Customer Persona (Busy Professional)

Figure 5 Persona 4 – Customer Persona

This persona represents an occasional customer who is not very familiar with digital booking systems and prefers a simple, clear interface. He likes to explore services, compare prices, and read barber profiles before making a decision. His main concern is confusion caused by complex screens or unclear service options. Therefore, the UI is designed with clear navigation, visual service menus, and detailed barber profiles with reviews to build trust and help him confidently complete bookings without feeling overwhelmed.

Persona 5 – Customer Persona (Occasional / Casual Customer)*Figure 6 Persona 5 – Customer Persona*

This persona represents a young, budget-conscious user who is highly comfortable with technology but sensitive to prices. He often looks for discounts, loyalty rewards, and offers, and prefers joining the walk-in queue rather than pre-booking. His main frustration is missing promotions or not knowing the real-time queue status. Therefore, the UI is designed to highlight offers and loyalty points on the home screen, provide real-time queue updates, and send notifications about discounts, ensuring that he feels rewarded and engaged with the app.

<https://canva.link/6k32iijfl3qkj0r>

Summary

Persona Type	Key Focus	Main Needs
Owner	Business Growth & Analytics	Revenue tracking, reports, loyalty insights
Operational Admin	Daily Operations & Workflow	Daily Operations & Workflow
Customer 1 (Busy Professional)	Speed & Convenience	Fast booking, notifications, saved preferences
Customer 2 (Casual User)	Clarity & Trust	Simple UI, barber profiles, reviews
Customer 3 (Student)	Budget & Offers	Discounts, loyalty points, queue visibility

Table 2 Summary for persona

USER FLOW

The user flow was designed to ensure a simple, fast, and intuitive booking experience for customers using the Mr. Barber application.

The flow focuses on minimizing steps required to complete a booking while maintaining clarity at each stage.

Customer Flow:

Figure 7 - Mr. barber Customer Flow Diagram

1. User opens the landing screen
2. User select queue or book now options
3. User select logs in or signs up
4. User selects a service type (haircut, beard trim, etc.)
5. User selects a service options (haircut styles. Beard trim styles, etc.)
6. User chooses a preferred barber
7. User selects available date and time
8. User confirms booking
9. Booking confirmation is displayed

Barber/Admin Flow:

Figure 8 - Mr barber Admin Flow Diagram

1. Barber logs into dashboard
2. Views dashboard
3. Views upcoming appointments
4. Updates availability
5. Tracks daily schedule

This structured flow ensures both customers and barbers can interact efficiently within the system without confusion or unnecessary steps.

<https://www.figma.com/design/memp9sqitenMqAHX1lufdm/Mr.-Barber?node-id=343-232&t=a1zsLMeegSXJJUIF-1>

WIREFRAMES

Wireframes were created as a low-fidelity representation of the application to focus on structure, layout, and user experience rather than visual design.

The purpose of wireframing was to define the placement of elements and ensure that the user flow remains simple and intuitive before applying visual styling.

Key Focus Areas:

- Layout Structure – Defining where each UI component should be placed
- Navigation Flow – Ensuring smooth movement between screens
- Content Hierarchy – Prioritizing important information for users
- User Experience – Making the booking process simple and efficient

The wireframes helped validate design decisions early in the process and reduced the need for major changes during the final UI design stage.

Figure 9 - customer wireframe - welcome page

The Welcome Page wireframe is structured into five clearly defined sections to ensure an organized and user-friendly layout. The first section includes a menu button positioned at the top-left corner, followed by a welcome message, the barber shop title, barber shop logo and two primary action buttons labeled “Walk-in Queue” and “Book Now,” which are strategically placed to encourage immediate user engagement. The second section presents an About area that provides brief information about the barber shop to build trust and brand awareness. The third section showcases three featured images to visually highlight key services or shop qualities. The fourth section displays the available services with arrow buttons on both sides, allowing users to quickly navigate and preview different services. Finally, the footer section contains essential information such as location, opening and closing times, contact number, embedded map, quick links, and social media links, ensuring easy access to important business details.

Figure 10 - customer wireframe - Login page

The Login Page wireframe is designed with a simple and user-friendly structure to ensure smooth access to the system. At the top-left corner, a menu or back arrow button is provided to allow users to navigate to the previous page easily. Below that, a welcome message along with the barber shop title is displayed to maintain brand consistency. The main section includes input text fields for the username and password, followed by a clearly visible “Login” button to proceed with authentication. Additionally, alternative login options such as “Login with Facebook” and “Login with Google” are included to provide convenience and faster access. At the bottom of the page, a “Sign Up Now” button is placed to guide new users toward account registration.

The wireframe shows a mobile app interface for a barber shop named 'Mr. Barber'. At the top left is a back arrow icon. The header text reads 'Welcome to' followed by a placeholder icon (a square with an 'X') and the shop name 'Mr. Barber'. Below this is a 'Signup now' section containing four input fields: 'User name', 'Phone number', 'Password', and 'Confirm password'. A dark 'Signup now' button is positioned below these fields. At the bottom, under the heading 'Or signup with', are two buttons: 'Signup via facebook' and 'signup via google'.

Figure 11 - customer wireframe - Signup page

The Sign Up Page wireframe is structured to provide a clear and simple registration process for new users. At the top-left corner, a menu or back arrow button is included to allow users to return to the previous page easily. Below this, a welcome message along with the barber shop title is displayed to maintain visual consistency and brand identity. The main section contains input fields for username, phone number, password, and confirm password, followed by a clearly positioned “Sign Up” button to complete the registration process. Additionally, alternative registration options such as “Sign Up with Facebook” and “Sign Up with Google” are provided to offer users a quicker and more convenient way to create an account.

Figure 12 - customer wireframe - service type page

The Service Type Page wireframe is designed to allow users to easily browse and understand the available services before making a booking. At the top-left corner, a menu or back arrow button is provided to enable smooth navigation to the previous page. The main content area displays each service inside separate container boxes to ensure clarity and visual organization. Within each container, the service type is presented as the main heading, followed by a brief service description and the estimated service duration. This structured layout helps users quickly compare different services and select the most suitable option based on their needs and time availability.

Figure 13 - customer wireframe - style type page

The Style Type Page wireframe is structured to help users select a specific style within a chosen service category. At the top-left corner, a menu or back arrow button is provided to allow users to return to the previous page easily. The main section displays each available style option inside separate container boxes for better organization and clarity. Each container includes the style type as the heading, followed by a brief style description and the corresponding price. An eye icon button is included in each box to allow users to navigate to a detailed view page for more information about the selected style. At the bottom of the page, the total price range of the selected style is dynamically displayed, followed by a “Next” button that enables users to proceed to the next step in the booking process.

Figure 14 customer wireframe - style view page

The Style View Page wireframe is designed to provide detailed information about a selected style before the user confirms their choice. At the top-left corner, a menu or back arrow button is included to allow users to easily navigate back to the previous page. The main content area presents picture of that style and the style information inside separate container boxes for clear organization and readability. Each container displays important details such as the style description, estimated duration, price, and what is included in the service. This structured layout ensures that users fully understand the selected style and its features before proceeding further in the booking process.

Figure 15 - customer wireframe - barber page

The Barber Page wireframe is designed to allow users to choose their preferred barber in a clear and organized manner. At the top-left corner, a menu or back arrow button is provided to enable easy navigation to the previous page. The main section displays each barber inside separate container boxes, ensuring a clean and structured layout. Within each container, the barber's name, years of experience, rating, and an eye icon button are included, allowing users to view more detailed information about the selected barber. At the bottom of the page, the name of the selected barber is displayed along with a "Next" button, enabling users to proceed to the next step in the booking process.

Figure 16 - customer wireframe - barber view page

The Barber View Page wireframe is designed to provide detailed information about a selected barber before confirming the booking. At the top-left corner, a menu or back arrow button is included to allow users to easily navigate back to the previous page. The page prominently displays the barber's photo to help users visually identify the professional. Below the image, barber-related details are organized into separate container boxes for clarity and readability. These containers include information such as the barber's name, specialties, availability schedule, rating, and customer reviews. This structured layout ensures that users can review all relevant details and make an informed decision before proceeding further in the booking process.

Figure 17 - customer wireframe - date and time page

The Date and Time Page wireframe is designed to allow users to schedule their appointment conveniently and accurately. At the top-left corner, a menu or back arrow button is provided to enable easy navigation to the previous page. The main section includes a calendar component where users can select their preferred appointment date. Below the calendar, available time slots are displayed, allowing users to choose a suitable appointment time based on availability. At the bottom of the page, the selected date and time are clearly shown for confirmation, followed by a “Next” button that enables users to proceed to the next step in the booking process.

The wireframe shows a mobile app screen titled 'Book appointment' with a back arrow icon. Below the title is the section 'Your details'. It contains several input fields and summary boxes: 'Full name' and 'Phone number' are grouped in a box; 'Selected date and time', 'Selected service', and 'Total price details' are grouped in another box; and 'Cash on hands', 'Credit card', and 'Points' are grouped in a third box. Below these is a 'Select payment method' label with an upward arrow icon. At the bottom is a 'Next' button.

Figure 18 - customer wireframe – customer detail page

The Customer Details Page wireframe is designed to collect essential customer information and confirm appointment details before proceeding to payment. At the top-left corner, a menu or back arrow button is provided for easy navigation to the previous page. The main section includes text fields where users can enter their name and contact number. Below this, container boxes display the previously selected appointment date and time, chosen services or styles, and the total price, allowing users to review their selections. A dropdown menu is provided for users to select their preferred payment method. Finally, a “Next” button is placed at the bottom of the page, enabling users to proceed to the payment or confirmation step of the booking process.

The wireframe shows a mobile app interface for booking an appointment. At the top, there is a back arrow and the title 'Book appointment'. Below the title is the subtitle 'Credit / debit card'. The main form area contains four stacked text input fields labeled 'Card number', 'Expiry', 'CVV', and 'Name on card'. Below these fields is a section titled 'Save card detail' with a checked checkbox. A paragraph of text explains that the card will be saved for convenience and that it can be removed by unchecking the box. At the bottom of the form is a prominent 'Pay now' button.

Figure 19 - customer wireframe – card detail page

The Card Details Page wireframe is designed to securely collect payment information from the user. At the top-left corner, a menu or back arrow button is provided to allow easy navigation to the previous page. The main section includes text fields for entering the card number, expiry date, CVV, and the cardholder's name. A checkbox is included to reassure users that their card details are stored securely and handled safely. At the bottom of the page, a prominently placed "Pay Now" button allows users to complete the payment and confirm their booking.

Figure 20 - customer wireframe – booking confirmed page

The Booking Confirmation Page wireframe is designed to provide users with a clear summary of their completed appointment and payment. At the top-left corner, a menu or back arrow button is included to allow easy navigation to the previous page. The main section displays a prominent “Booking Confirmed” message to immediately inform the user that their appointment has been successfully scheduled. Below this, a detailed bill-like container presents the customer’s name, phone number, appointment date and time, selected service, chosen barber, service duration, total price, and payment method, giving users a complete overview of their booking. At the bottom of the page, a “Thank You for Booking” message is displayed to acknowledge the user and enhance the overall experience.

Figure 21 - customer wireframe – user account page

The User Account Page wireframe is designed to give users easy access to their booking history and account management options. At the top-left corner, a menu or back arrow button is included to allow navigation to the previous page. The main section features user image and a switch button that lets users toggle between Current Booking and Past Booking History, providing a clear view of all their appointments. Each booking entry is displayed in a container showing detailed information, including the selected service, barber details, appointment date and time, and a bill summary. At the bottom of the page, quick-access buttons for Notifications, Offers, and Settings are included to allow users to easily manage account-related features and stay updated on promotions.

Figure 22 - customer wireframe – offer page

The Offers Page wireframe is designed to allow users to easily browse and explore available promotions. At the top-left corner, a menu or back arrow button is included to navigate back to the previous page. The main section features a switch button that lets users toggle between Combo Offers and Price Drop Offers, providing an organized way to view different types of promotions. Each offer is displayed in a container with details such as the offer title, description, duration, and any applicable discounts, ensuring users have all the information they need to take advantage of the promotion.

Figure 23 - customer wireframe – walk in queue

The Walk-In Queue Page wireframe is designed to help users manage and track their position in the barber shop's live queue. At the top-left corner, a menu or back arrow button is provided for easy navigation to the previous page. The main section displays a container showing live queue details, giving users real-time updates on the ongoing queue. Below that, another container shows waiting people count and estimated waiting time, helping users plan their visit efficiently. At the bottom, a prominently placed "Join Queue" button allows users to enter the virtual queue and receive notifications when it is their turn.

<https://canva.link/o0f287joymjptpu>

Wireframes of Mr. Barber's Admin user interface

Figure 24 - admin wireframe – login page

The Admin Login Page wireframe displays a welcome message at the top, followed by the barbershop title and logo to reinforce brand identity. Below this, the login section is structured within a centered container box labeled “Login Now.” Inside the container, there are input fields for username and password, allowing the administrator to enter credentials securely. A login button is positioned beneath the input fields to proceed to the admin dashboard upon successful authentication. Below the login button, the barbershop slogan, “Book Smart, Look Sharp,” is displayed to maintain branding consistency and provide a professional touch to the login interface.

Figure 25 - admin wireframe – dashboard

The Admin Dashboard wireframe is designed to give the barber shop administrator a clear and organized overview of operations. The left-side container displays a welcome message, the admin's profile and username, and the barber shop title with logo, followed by navigation buttons for Dashboard, Appointments, Queue, Barbers, Services, Customers, and Loyalty for easy access to different sections. The main area features three mini containers showing Revenue Details, Appointment Details, and Walk-In Details, followed by two revenue graphs to visualize financial trends. At the bottom, a container displays recent appointment details, allowing the admin to quickly monitor bookings and daily activities in a single view.

Figure 26 - admin wireframe – appointments

The Admin Appointments Page wireframe is designed to give the admin full control over managing bookings efficiently. The left-side container includes a welcome message, the admin's profile and username, and the barber shop title with logo at the top. Below that, navigation buttons for Dashboard, Appointments, Queue, Barbers, Services, Customers, and Loyalty allow quick access to different sections. The main section includes a date filter at the top to select appointments for specific days, followed by a search bar and tabs for All, Completed, In Progress, and Waiting appointments, enabling easy filtering and viewing. Below this, appointment details are displayed in a table with columns for ID, Service, Barber, Time, and Status, giving the admin a clear and organized overview of all bookings.

Figure 27 - admin wireframe – queue

The Admin Queue Page wireframe is designed to help the barber shop administrator efficiently monitor and manage the live queue. The left-side container includes a welcome message, the admin's profile and username, and the barber shop title with logo at the top, followed by navigation buttons for Dashboard, Appointments, Queue, Barbers, Services, Customers, and Loyalty for quick access to different sections. In the main section, three separate mini containers display Waiting Count, On-Chair Count, and Estimated Completion Time, providing a quick overview of the current queue status. Below these, a detailed table lists the queue entries with columns for ID, Service, Barber, Time, and Status, allowing the admin to track each customer's progress and manage operations effectively.

Figure 28 - admin wireframe – barbers

The Admin Barbers Page wireframe is designed to help the barber shop administrator manage all barbers efficiently. The left-side container includes a welcome message, the admin's profile and username, and the barber shop title with logo at the top, followed by navigation buttons for Dashboard, Appointments, Queue, Barbers, Services, Customers, and Loyalty for easy access to different sections. In the main section, a “Add Barber” button is placed at the top to allow the admin to quickly add new barbers. Below this, each barber is displayed in a separate container showing their photo, name, specialties, availability, and reviews, providing a clear and organized overview for effective management.

Figure 29 - admin wireframe – services

The Admin Services Page wireframe is designed to enable the barber shop administrator to manage all offered services efficiently. The left-side container includes a welcome message, the admin's profile and username, and the barber shop title with logo at the top, followed by navigation buttons for Dashboard, Appointments, Queue, Barbers, Services, Customers, and Loyalty for easy access to other sections. In the main section, a date filter at the top allows the admin to view services for specific days or periods. Below this, service category tabs such as All, Haircut, Beard, Hair wash, and Facial enable quick filtering of different service types. A detailed table shows the services with columns for Service Name, Category, Description, Price, Duration, and Action, giving the admin a clear and organized overview for managing and updating service details.

Figure 30 - admin wireframe – customers

The Admin Customers Page wireframe is designed to help the barber shop administrator efficiently manage customer information and loyalty details. The left-side container includes a welcome message, the admin's profile and username, and the barber shop title with logo at the top, followed by navigation buttons for Dashboard, Appointments, Queue, Barbers, Services, Customers, and Loyalty for easy access to different sections. In the main section, a date filter at the top allows the admin to view customer activity for specific periods. Below this, a search bar and category tabs such as All, Premium, Silver, Gold enable filtering and quick selection of customer types. The customer details are displayed in a table with columns for Name, Phone Number, Bill Amount, and Points, giving the admin a clear overview of all customer information and loyalty status.

Figure 31 - admin wireframe – loyalty

The Admin Loyalty Page wireframe is designed to help the barber shop administrator manage customer loyalty programs effectively. The left-side container includes a welcome message, the admin's profile and username, and the barber shop title with logo at the top, followed by navigation buttons for Dashboard, Appointments, Queue, Barbers, Services, Customers, and Loyalty for easy access to other sections. In the main section, three mini containers at the top display the count of Platinum, Gold, and Silver members, providing a quick overview of loyalty membership. Below this, the Offers Section includes buttons for Price Drop Offers and Combo Offers, allowing the admin to switch between offer types and view details, along with an “Add Offers” button to create new promotions. A revenue graph is displayed below the offers section to visualize loyalty-driven income, and at the bottom, a container shows recent redemption details, giving the admin insights into member activity and rewards usage.

DESIGN SYSTEM

The design system was created to ensure consistency, scalability, and visual harmony across the entire Mr. Barber application.

It defines reusable UI components, color rules, typography styles, spacing guidelines, and interaction patterns used throughout the product.

Key Components of the Design System:

- **Color System**
 - a high-contrast palette was used to create a bold and premium barber brand identity.
 - Primary color: Vibrant Orange (#EE8B22)
 - Background: White and Black
 - Supporting Gray tones for secondary elements
- **Typography System**
 - a clean sans-serif font was used to maintain readability and modern aesthetics.
 - Heading styles are bold and prominent to establish clear hierarchy.
- **Buttons & Inputs**
 - Consistent button styles were defined with rounded corners and strong visual contrast.
 - Input fields use simple borders and minimal styling for clarity.
- **Cards & Layouts**
 - Card-based UI was used for services, barbers, and bookings to improve structure and readability.
 - Layouts follow a mobile-first compact spacing system.

➤ Spacing System

a consistent spacing scale was applied to ensure balanced and structured UI alignment.

➤ Reusable Components

All UI elements such as buttons, cards, and navigation components were designed to be reusable across screens to improve scalability.

The design system ensured that all screens maintained a unified visual language and improved the overall user experience.

Figure 32 Mr. Barber system colors

Figure 33 - Mr. Barber system typography

Figure 34 - Mr. Barber system components

Figure 35 Mr. Barber system iconography

Figure 36 - Mr. Barber system iconography

<https://www.figma.com/design/memp9sqitenMqAHX1lufdm/Mr.-Barber?node-id=343-234&t=CQDiaQikZMuJOVPd-1>

FINAL UI & OUTCOME

The final UI design represents a complete mobile-first barber booking experience built with a focus on usability, clarity, and visual consistency.

Each screen was designed using the established design system to ensure a cohesive and professional user experience across the application.

Final UI & outcome of Mr. Barber's customer user interface

Figure 37 - customer prototype – home page

The prototype initially displays the Welcome Page, which serves as the main entry point of the system. This page includes a welcome message along with the barber shop title and logo to

establish brand identity. Below this section, two primary action buttons “Walk-In Queue” and “Book Now” are provided to allow users to quickly choose their preferred method of service engagement.

The “Walk-In Queue” and “Book Now” buttons were designed as components with hover state variants. In the default state, the buttons appear in orange, and when hovered over, the color changes to gray. This hover effect improves visual feedback and enhances user interaction.

Figure 38 Walk-In Queue and Book Now button hover effect

Figure 39 component creating steps

To ensure consistency and enhance interactivity within the prototype interface, reusable user interface components were developed using a component-based design approach. The following section describes the detailed procedure used to create an interactive component, taking the Walk-In Queue button as an example.

Purpose of Component Creation

The Walk-In Queue button was designed as an interactive element to provide visual feedback during user interaction. In its default state, the button appears in an orange color, representing an active action button. When a user hovers over the button, the color changes to gray, indicating responsiveness and improving user experience.

Implementing this functionality through components enables reuse of the same design behavior across multiple system interfaces while maintaining visual consistency.

Steps Followed to Create the Component

The component creation process was carried out through the following steps:

1. Grouping Interface Elements

The Walk-In Queue text label and the surrounding button container were first selected together and grouped. This ensured that both elements function as a single interactive object.

2. Creating the Component

After grouping the elements, the Create Component option was selected from the design tool. This converted the grouped object into a reusable master component.

3. Generating Component Variants

The created component was then selected, and the Create Variant feature was applied to generate multiple states within a single component set.

4. Separating the Component Set

The component set containing the variants was moved outside the main design frame to allow independent editing without disturbing the existing layout.

5. Designing the Hover State

The newly created variant was modified by changing the button background color from orange to gray. This variant represents the hover interaction state.

6. Applying Prototype Interaction

Prototype interaction was added by linking the default button variant to the hover-state variant using the Hover trigger. This interaction enables automatic color transition when the cursor moves over the button.

7. Placing the Original Component Instance

Finally, the original component instance was duplicated by holding the Alt key and dragging it back into the required frame. The component was then positioned accurately in its intended layout location, ensuring alignment with the interface design while preserving component linkage.

8. Reusing the Component Across Interfaces

The finalized component instance was reused in all home pages. by duplicating and placing the component within required frames, ensuring consistent interaction behavior across multiple system pages.

Outcome

By following this structured component creation process, an interactive hover-effect button was successfully implemented. The use of component variants improves design scalability, maintains uniform interaction behavior, and simplifies future updates across the prototype.

Now get back in to flow, following the main action section, an About the Barber Shop segment is presented to give users a brief introduction to the business. Below this, a Featured Hairstyles section displays highlighted hairstyle images to visually attract users and showcase popular styles.

Next, the Our Services section provides a quick view of available services. Each service or hairstyle is displayed in a structured format with two navigation arrow buttons positioned on either side. These arrows allow users to scroll through and preview previous and next services easily, improving interactive browsing.

Figure 40 customer prototype – service quick view on home page

The Previous and Next arrow buttons within the Services section were developed as components with hover state color changes to provide consistent interactive feedback.

This component was reused in quick view service section.

Figure 41 previous and next button hovering effect

At the top of the page, a Menu Button is available for smooth navigation. When clicked, it displays options such as Home, Services, Our Barbers, Offers, and Profile, enabling users to quickly access different sections of the system.

Figure 42 customer prototype – navigation menu

The “Services” text in the navigation menu was also created as a component with a hover variant. When the user hovers over the text, the color changes to gray, indicating that it is clickable and interactive.

Figure 43 navigation hover effect

When users scroll further down, the Footer Section becomes visible. This section includes the barber shop’s location details, contact number, and an embedded map for easy navigation.

Additionally, quick links to Services, Our Barbers, Offers, and Profile are provided for faster interaction. Social media icons for Instagram, Facebook, TikTok, and WhatsApp are also included to enhance online engagement and customer connectivity.

Figure 44 customer prototype – footer

In the footer section, the Location option was created as a component with a hover color-changing effect. When users hover over the location text, the color changes, clearly indicating it is an interactive link.

Figure 45 location hover effect

Figure 46 customer prototype – login page

To prevent unwanted bookings and misuse of the walk-in queue system, user authentication is mandatory. When users click either the “Walk-In Queue” or “Book Now” button, they are redirected to the Login Page. This ensures that only registered users can proceed with booking or queue joining.

The Login Page includes a back button at the top corner to return to the home page, along with text fields for entering username and password.

Figure 47 login button click effect

The login button was designed as a component with a color-changing hover effect to enhance interactivity.

Figure 48password hide mode

An eye icon for hide and view password and it was designed as a component.

This component was reused in admin password field.

Additionally, users are provided with alternative login options such as Login with Facebook and Login with Google. If the user is not registered, a “Sign Up Now” button redirects them to the Sign-Up Page.

The image shows a mobile app interface for 'MR. BARBER'. At the top, there's a header with a back arrow, the text 'Welcome to', and a background image of a barber holding scissors and a comb. Below the header, the text 'MR. BARBER' and 'BOOK SMART, LOOK SHARP' are displayed. The main section is an orange box titled 'Signup now' containing four input fields: 'Enter your name', 'Enter your phone number', 'Password', and 'Confirm password'. Below these fields is a 'Signup now' button. At the bottom, there's a section titled 'Or signup with' with two buttons: 'Face book' (with a Facebook icon) and 'Google' (with a Google icon).

Figure 49 customer prototype – signup page

The Sign-Up Page contains input fields for username, phone number, password, and confirm password. Social registration options such as Sign Up with Facebook and Sign Up with Google are also included.

After successful login or registration, users who initially selected Walk-In Queue are redirected to the Walk-In Queue Page, while users who selected Book Now are directed straight to the Service Type Selection Page.

Figure 50 customer prototype – walk in queue page

On the Walk-In Queue Page, live queue details are displayed, including which customer is currently on the chair, who is waiting, the total waiting count, and estimated waiting time. A “Join Queue” button allows users to enter the queue. Upon joining, users proceed to the service selection process. From the Service Type Selection Page onward, the steps are the same for both Walk-In Queue and Appointment Booking users.

Figure 51 customer prototype – service type page

This page includes a back button, a booking step progress indicator at the top, and a list of available service types with descriptions and estimated durations.

Figure 52 service type hover effect

Hover color-changing effects were applied using components.

This component was reused in each service box.

Figure 53 customer prototype – style type page

After selecting a service type, users are redirected to the Style Selection Page, where available styles under the selected service are displayed with name, description, price, navigation arrows, and an eye icon for detailed viewing. User can scroll or select style type navigation buttons and view other service type styles too.

Figure 54 customer prototype – detailed style page

Clicking the eye icon opens the Style Detail Page, which includes the style image, description, duration, price, best suited for information, and included features. Users can return to the style page using the previous button. After selecting a style, the selected price and a Next button appear at the bottom, leading to the Barber Selection Page.

Figure 55 customer prototype – barber page

On the Barber Selection Page, users can view barber name, experience, rating, and access detailed information via an eye icon.

Figure 56 customer prototype – detailed barber profile page

The detailed barber page shows specialties, availability, ratings, and reviews. After selecting a barber, the selected barber name and a Next button appear.

Figure 57 customer prototype – date and time page

For appointment booking users (not walk-in queue users), the next step is the Date and Time Selection Page, where a calendar and available time slots are displayed. The Next button remains inactive until both date and time are selected.

Figure 64 customer prototype – booking confirmed

Upon successful payment, the Booking Confirmation Page is displayed with a booking progress indicator, confirmation message, and a bill-style summary including customer name, phone number, service, barber, date, time, duration, total amount, and payment method. A final message such as “*Your booking is confirmed! See you soon at Mr. Barber.*” is displayed.

Figure 65 customer prototype – account page booking history

Users can access their account through the Profile option in the menu. The Account Page displays booking history with toggle buttons for Current and Past bookings.

The image displays two side-by-side mobile app screens for 'MR. BARBER'. Both screens feature an orange header with a menu icon and the app name. Below the header, a user profile for 'Jaan' (Platinum customer) is shown. A yellow star icon and the text 'Give your honest review' are present on both screens.

Left Screen (Review Form):

- Service:
- Barber:
- Service:
- Review:
- Submit button (green)

Right Screen (Success Message):

- Service:
- Barber:
- Service:
- Success message: Successfully submitted
- Yes button (orange)
- Submit button (green)

Both screens have a bottom navigation bar with icons for notifications, wallet, and settings.

Figure 66 customer prototype – review form

And give review for past appointments after fill the review form, submit review by click submit button. After successful review submission, receive a popup message as “Successfully submitted”.

Figure 67 customer prototype – booking cancel

Users can cancel current bookings if necessary. At the bottom, quick-access buttons for Notifications, Coins, and Settings are provided.

Figure 68 customer prototype – account notification and coins page

Notifications display booking confirmations and queue alerts, while the Coins section shows earned and redeemed points' details. And user can return account booking history by click previous button.

Figure 69 customer prototype – offer page

Additionally, the Offers Page allows users to view active promotions. Users can switch between Combo Offers and Price Drop Offers using toggle buttons at the top.

Overall, the prototype demonstrates a complete and structured user journey from authentication to service selection, payment processing, booking confirmation, and account management. The design ensures interactive feedback, controlled access, and a consistent user experience throughout the booking and queue management system.

<https://www.figma.com/design/memp9sqitenMqAHX1lufdm/Mr.-Barber?node-id=0-1&t=T584vCAJiezEJoM9-1>

Final UI & outcome of Mr. Barber's admin user interface

Figure 70 admin prototype – login page

The Admin Prototype begins with the Admin Login Page, which ensures secure access to the management system. This page displays a welcome message followed by username and password input fields under a “Login Now” section. A password visibility toggle (eye icon) is implemented using interactive components, allowing the admin to hide or view the entered password.

Figure 71 hidden password

To improve usability and enhance secure data entry within the system, an interactive password visibility toggle component was developed. This component enables users to switch between hidden and visible password states while entering login credentials.

Purpose of Component Creation

The password input field includes an eye toggle icon, allowing users to view or hide the entered password when required.

By default, the password remains hidden using a masked (pin-pattern) format to maintain privacy. When the eye icon is selected, the password becomes visible, and selecting the icon again hides the password. This toggle-based interaction improves user convenience while maintaining security standards.

Additionally, this component was designed as a reusable element and was implemented across both administrator login pages and customer-side authentication interfaces, ensuring consistency throughout the system.

Steps Followed to Create the Component

The password visibility toggle component was created using the following structured procedure:

01. Grouping Interface Elements

The password input box, password text field, and eye icon were initially selected together and grouped. This ensured that all related elements function as a single interactive unit.

02. Creating the Component

After grouping the elements, the Create Component option was selected to convert the grouped object into a reusable master component.

03. Creating Component Variants

The created component was then selected, and the **Create Variant** option was applied. This allowed multiple interaction states of the password field to be managed within one component set.

04. Moving the Component Set outside the Frame

The generated component set was moved outside the main design frame to safely modify interaction states without affecting the interface layout.

05. Designing the Hidden Password State

In the added variant, the password text was modified into a masked pin-pattern format to represent the hidden password state. Simultaneously, the eye icon was changed to indicate restricted visibility.

06. Designing the Visible Password State

The original variant retained the readable password text along with the visible eye icon, representing the password view state.

07. Applying Toggle Interaction

Prototype interaction was added by linking both variants using the On Click interaction trigger, enabling toggle behavior between hidden and visible password states whenever the eye icon is selected.

08. Reusing the Component across Interfaces

The finalized component instance was reused in customer-side password fields by duplicating and placing the component within required frames, ensuring consistent interaction behavior across multiple system pages.

Outcome

Through the implementation of component variants and toggle interactions, a functional password visibility mechanism was successfully achieved. The reusable component approach

minimizes repetitive design work, maintains interface consistency, and enhances user experience across both administrator and customer modules.

Now get back in to flow, when valid credentials are entered and the Login button is clicked, the system redirects the admin to the Admin Dashboard.

The Admin Dashboard consists of seven main navigation frames: Dashboard, Appointments, Queue, Barbers, Services, Customers, and Loyalty. These navigation buttons are displayed on the left-side panel below the welcome message and admin user details. The currently active frame is highlighted in a different color to clearly indicate the selected section.

Figure 72 admin prototype – dashboard page

Within the Dashboard Frame, three mini containers display key daily metrics such as Today's Revenue, Today's Appointments, and Today's Walk-ins. below these, visual graphs such as Customer Growth and Weekly Revenue provide performance insights. A Recently Appointments section is displayed in table format, including customer name, service, time, and service status details.

MR. BARBER UI/UX Case Study

Figure 73 admin prototype – appointment page

The Appointments Frame includes date-wise filter buttons, a search bar for quick look up, and status-based filter buttons (e.g., Completed, Waiting, and In Progress).

Figure 75 admin prototype – appointment status wise filtered

Id	Service	Barber	Time	Status
1001	Fade cut	Anan	11 AM	Completed
1006	Crew Taper	Abish	10 AM	Completed

Completed
Completed
In progress
Waiting

Figure 74 appointment status update

Appointment data is displayed in a table with columns such as ID, Service, Barber, Time, and Status. The service status can be updated through a dropdown component, allowing the admin to change the status dynamically. And this component reused in queue page.

Figure 76 admin prototype – queue page

The Queue Frame displays live queue statistics in mini containers, including Waiting Count, On-Chair Count, and Estimated Completion Time. Below this, queue details are presented in a table format with ID, Service, Barber, Time, and Status columns. Similar to the Appointments section, the queue status can be updated using a dropdown component.

Figure 77 queue status update

Figure 78 admin prototype – barber page

In the Barbers Frame, an “Add Barber” button is positioned at the top. Existing barber details including photo, name, specialties, availability, and reviews are displayed in separate containers for clarity.

Figure 79 admin prototype – barber page add barber form

When the Add Barber button is clicked, a form appears with input fields for barber details. Interactive components are used so that placeholder text disappears and the input field color changes upon user interaction.

Figure 80 place holder cleared and text field color changing

The Add Barber button remains inactive until all required fields are completed.

MR. BARBER UI/UX Case Study

Figure 81 barber add form filled version and successfully added pop up message

After successful submission, a confirmation dialog box displays a success message.

Figure 82 barber delete confirmation and successfully deleted message

When the delete button is clicked, a form appears with delete confirmation dialog message box and can delete successfully.

Figure 83 admin prototype – service page

The Services Frame includes an “Add Service” button at the top and category filter buttons (All, Haircut, Beard, Hair wash, Facial) above the service table. Service details are displayed in a table with columns such as Style, Description, Price, Duration, and Action.

The image shows a UI prototype for the 'Mr. Barber' admin interface. On the left is a sidebar with a 'Welcome' section for 'Admin: Loga' and a 'Mr. Barber' section with navigation links: Dashboard, Appointments, Queue, Barbers, Services (highlighted), Customers, and Loyalty. The main content area is titled 'Services' with the subtitle 'Manage our service menu'. It features an 'Add style' button and filter buttons for 'All', 'Hair cut', 'Beard', 'Hair wash', and 'Facial'. A modal form titled 'Add style details' is open, containing input fields for 'Style name' (Beard line-up), 'Description' (Sharp trimming for clean beard edges), 'Style Includes' (Beard trim + line shaping), 'Style price' (700.00), 'Duration' (15 - 20 min), and 'Categeory' (Beard). Below the form is a green 'Add service' button. At the bottom, a table lists existing services, including 'Beard Line-Up' with a price of 700.00 and a duration of 20 min.

Style name	Description	Style Includes	Style price	Duration	Categeory
Beard line-up	Sharp trimming for clean beard edges	Beard trim + line shaping	700.00	15 - 20 min	Beard

Figure 84 admin prototype – service page add style form

When the Add style button is clicked, a form appears with input fields for style details such as style name, description, style includes, style price, duration and style category. And display dialog message box as “successfully added style”.

Figure 89 admin prototype – service wise filtered options

Admin can view selected service options by click service filter button.

Figure 90 admin prototype – customer page

The Customers Frame contains a search bar and tier-based filter buttons (All, Platinum, Silver, and Gold). Customer details are displayed in a table format with columns such as Name, Phone Number, Bill Amount, and Points, enabling easy management of customer loyalty tiers.

Figure 91 admin prototype – tiers wise filtered customers

Admin can view tier wise customers by click tier-based filter buttons.

Figure 92 admin prototype – loyalty page

Finally, the Loyalty Frame displays mini containers showing the count of Platinum, Gold, and Silver members. A monthly redemption graph provides insights into reward usage trends.

Figure 93 admin prototype – offer type wise filtered offers

The Offers section includes an “Add Offers” button and toggle buttons for Price Drop Offers and Combo Offers, allowing the admin to switch between offer types.

Figure 94 admin prototype – Loyalty page add offer form

Clicking Add Offers opens a form requiring details such as offer name, description, category, service price, validity period, and eligible membership tier.

Figure 95 offer successfully added message

After submission, a success dialog message is displayed.

Figure 96 offer delete confirmation and successfully deleted message

If the Delete button is selected for an offer, a confirmation prompt appears before permanently removing it, followed by a successful deletion message.

Overall, the Admin Prototype demonstrates a structured and interactive management system that enables efficient control over appointments, queue operations, barbers, services, customers, and loyalty programs. The use of components, interactive elements, confirmation

dialogs, and status updates ensures consistency, usability, and effective administrative workflow management.

<https://www.figma.com/design/memp9sqitenMqAHX1lufdm/Mr.-Barber?node-id=0-1&t=T584vCAJiezEJoM9-1>

KEY FEATURES

The Mr. Barber application was designed to provide a seamless and efficient appointment booking experience for customers while helping barbers manage their schedules effectively.

➤ Online Appointment Booking

Users can schedule appointments in advance without visiting the barber shop or making phone calls.

➤ Service Browsing

Customers can explore available grooming services and select the option that best suits their needs.

➤ Barber Selection

Users can view available barbers and choose their preferred barber before confirming a booking.

➤ Time Slot Management

The system allows customers to select available dates and time slots based on barber availability.

➤ User Authentication

Secure login and signup functionality enables users to manage their bookings and profiles.

➤ Mobile-First Experience

The application is optimized for mobile devices, ensuring accessibility and convenience for users on the go.

➤ Booking Confirmation

Users receive clear confirmation after successfully completing an appointment booking.

➤ Simple Navigation

The interface is designed with a clean and intuitive navigation structure to reduce user effort and improve usability.

CHALLENGES & SOLUTIONS

Challenge 1: Simplifying the Booking Process

✓ Challenge:

Users should be able to complete a booking quickly without navigating through too many screens or steps.

✓ Solution:

A streamlined user flow was created that guides users through service selection, barber

selection, appointment scheduling, and booking confirmation in a simple and logical sequence.

Challenge 2: Designing for Mobile Devices

✓ **Challenge:**

The application was designed primarily for mobile users, requiring efficient use of limited screen space.

✓ **Solution:**

A mobile-first approach was adopted with clear visual hierarchy, compact layouts, prominent call-to-action buttons, and simplified navigation patterns.

Challenge 3: Maintaining Visual Consistency

✓ **Challenge:**

Ensuring all screens followed a consistent visual language and interaction pattern.

✓ **Solution:**

A reusable design system was created, including color styles, typography, buttons, input fields, spacing guidelines, and UI components.

Challenge 4: Improving Appointment Visibility

✓ **Challenge:**

Users need to quickly understand available services, barbers, and appointment options.

✓ **Solution:**

Information was organized using card-based layouts, clear labels, and structured booking screens to improve readability and decision-making.

Challenge 5: Creating an Intuitive User Experience

✓ **Challenge:**

Users with different levels of technical experience should be able to use the application comfortably.

✓ **Solution:**

Simple navigation patterns, familiar interface components, and clear feedback mechanisms were incorporated to reduce learning effort and improve usability.

Challenge	Solution
Complex Booking Process	Simplified User Flow
Limited Mobile Space	Mobile-First Design
UI Consistency	Design System
Appointment Visibility	Structured Information Layout
Ease of Use	Intuitive Navigation

Table 3 - Challenges and solution

OUTCOME

The Mr. Barber mobile application successfully transformed a traditional barber appointment process into a modern digital booking experience.

The final solution provides users with a convenient and intuitive platform for discovering services, selecting barbers, scheduling appointments, and managing bookings through a streamlined mobile interface.

By applying user-centered design principles throughout the design process, the project addressed key user pain points and improved the overall appointment booking experience.

Key Achievements

- Reduced the complexity of the appointment booking process.
- Improved accessibility through a mobile-first design approach.
- Enhanced appointment visibility and scheduling convenience.

- Established a consistent and scalable design system.
- Created a clear and intuitive user journey from service selection to booking confirmation.
- Delivered a professional high-fidelity prototype demonstrating the complete booking workflow.

Learning Outcomes

This project strengthened skills in:

- UX Research
- User Persona Creation
- User Flow Design
- Wireframing
- Design Systems
- Mobile UI Design
- Interactive Prototyping
- User-Centered Design Thinking

Conclusion

The Mr. Barber case study demonstrates an end-to-end UI/UX design process, from research and problem identification to final interface design and prototyping. The project highlights the ability to create practical, user-focused digital experiences while maintaining visual consistency and usability standards.

TOOLS USED

Design Tools

➤ Figma

Used for:

- High-Fidelity UI Design
- Component Creation
- Design System Development
- Interactive Prototyping
- User Flow Diagrams

➤ Canva

Used for:

- Wireframing
- Persona Design
- Visual Presentation Assets
- Supporting Graphics
- Logo designing

Documentation Tools

➤ Microsoft Word

Used for:

UX Case Study Documentation

Project Reporting

Design Process Presentation

Version Control & Portfolio Tools

➤ GitHub

Used for:

Project Showcase

Portfolio Presentation

Design Documentation Storage

Skills Applied During the Project

- UX Research
- User Analysis
- Persona Creation
- User Flow Design
- Wireframing
- Design Systems
- Mobile UI Design
- Prototyping
- User-Centered Design
- Visual Design
